

The Powerpc Macintosh: The Inside Story on the New Risc-Based Macintosh

Recently, Apple, IBM, and Motorola formed an alliance to develop the next generation of computer technology, the PowerPC chip. Here is the inside story on this new technology that will put Apple ahead of Intel and Microsoft both technologically and economically. This book explains why the PowerPC chip is so important, how to upgrade, what's different from 680x0 machines, and how to migrate applications.

Idiots Guide to the Mac, 2nd ed. The PowerPC Macintosh Book: The Inside Story on the New RISC-Based Macintosh
Apples Intel transition was the process of changing the central processing unit (CPU) of Macintosh computers from PowerPC processors to Intel x86 processors. The transition marked the Macintosh platforms second migration to a new CPU. It is also the last Mac OS X version that support PowerPC based applications. The Apple Mac made its debut in 1984 running Motorolas 68k chips, then the most efficient in the PC industry. Apple switched to RISC in March 1994, the first PowerPC Macs a just-in-time instruction translation based on code from Transitive .
