

Unified Memory Management System (Europäische Hochschulschriften / European University Studies / Publications Universitaires Europeennes)

In object-oriented programming languages, the locality of methods manipulating exactly one object stands in contrast to the globality of transactions used for accessing databases. In order to allow the programmer to define methods without knowing the context within which they will be executed, the author defines a new concept, the Atomic Method, which can be used instead of transactions in most situations. An interesting application of the Atomic Method concept is the Unified Memory Management System, which presents the whole set of a computers memories to the user as one large, uniform, and persistent object store.
